Problem Statement: Block-chain based certificate validation

Team Leader Name: katika naga anjaneyulu

Problem Code: HRD6

College code:1-3513699244

Storing the school/university/board certificates is a recurring process. For the Organization, verifying the authenticity of the certificates is tedious and cumbersome . The proposed solution will help the institutions to store the certificates in the decentralized way using the block-chain system and give access to any organizations or any institution with the consent of the individual using multi-sign. What we want: sharable decentralized storage using digital signature and access

Technology Stack:

- Ethereum Smart Contracts
- Node.js
- Firebase (API)
- Web3js (API)
- Express WEB framework

Now Using

Idea

- The basic idea is to create a web based application with interface for Certificate Issuer , verification and access.
 - The trusted entities like Universities will have the authority to add new certificates on the blockchain through the CryptoCerts DAPP(Decentralised Application).
 - **Verification:** One can verify the Certificate by uploading json file in the verify page .
 - **Multi Signature Wallet:** Every Certificate is tied to three parties namely entitled user, Govt , Issuer.
-
- Since the hashes are stored on the blockchain rather than the actual certificates the privacy and identity theft is prevented.
 - The MultiSignature wallet allows the control over the wallet be shared between entities rather than a single authority to prevent misuse.
 - Since the certificates are stored on blockchain and because of its immutability it's tamper proof and fraud resistant.
